

KEEVAN STORE

Manual Actions Required

A step-by-step guide for completing setup tasks that cannot be done within the codebase itself. Each item explains **what** needs to be done, **why** it matters, and **exactly how** to do it — no technical jargon left unexplained.

Document:	Manual Actions Required
Project:	Keevan Store v2
Prepared:	2026-03-04
Status:	Action Required

1

WhatsApp Support & Notifications

Keevan Store uses **direct WhatsApp links** for customer support and admin notifications. No third-party bot (like CallMeBot) is required. When customers click the WhatsApp support button on the site, they are taken directly to a WhatsApp chat with the admin number. Admin notifications (new orders, withdrawals, contact form submissions) are logged to the server console with follow-up WhatsApp links.

How it works:

1. Customer clicks the WhatsApp support button on any store page
2. They are redirected to `wa.me/256768345905` with a pre-filled message
3. Admin receives the message directly in WhatsApp — no API key needed
4. For admin notifications (withdrawals, contact forms), check the admin dashboard at `keevanstore.in/admin`
5. Server logs also print notification messages with follow-up WhatsApp links

No CallMeBot or third-party WhatsApp bot is needed. All communication goes through direct WhatsApp links.

2

Register Your Pesapal IPN URL

Pesapal needs to know where to send payment confirmations. This is called the **"IPN URL"** and it must be registered in your Pesapal merchant dashboard.

What to do:

1. Log in to your Pesapal merchant dashboard at `https://developer.pesapal.com`
2. Go to **"IPN Settings"** or **"Webhook Configuration"**
3. Enter this URL: `https://keevanstore.in/api/pesapal/ipn`
4. Select **"POST"** as the method
5. Save the settings
6. Pesapal will send a test notification — check your server logs to confirm it was received

Without this, Pesapal will not notify your site when payments complete, and orders will stay in "pending" status forever.

3

Configure Cloudflare R2 Bucket CORS

If creators are having trouble uploading files (photos, product files), it might be because your R2 bucket is not allowing uploads from your website domain.

What to do:

1. Log in to your Cloudflare dashboard at <https://dash.cloudflare.com>
2. Go to **"R2 Object Storage"** and click on your bucket
3. Go to the **"Settings"** tab
4. Find **"CORS Policy"** and click **"Edit"**
5. Add a rule with these settings:

Setting	Value
Allowed Origins	https://keevanstore.in
Allowed Methods	GET, PUT, POST, DELETE
Allowed Headers	*
Max Age	86400

6. Save the rule

4

Confirm Supabase RLS Is Enabled

Row Level Security (RLS) is the feature that prevents one creator from seeing or editing another creator's data. It is defined in the code, but it must also be **enabled in the Supabase dashboard**.

What to do:

1. Log in to your Supabase dashboard at <https://supabase.com>
2. Select your project
3. Go to the **"Table Editor"**
4. For each table listed below:
 - a) Table: creators
 -) Table: products
 -) Table: events
 -) Table: orders

-) Table: page_views
-) Table: donations
-) Table: withdrawals
-) Table: tickets
-) Table: download_sessions
- a) Click on the table name
- b) Click the "RLS" tab at the top
- c) Make sure "Enable RLS" is turned ON
- d) Check that the policies listed match those in the file supabase/schema.sql

If RLS is not enabled on any table, anyone could potentially read or modify other creators' data.

5 Run the SQL Schema Setup

The database schema (tables, indexes, RLS policies, and helper functions) needs to be applied to your Supabase database. This is a **one-time setup**.

What to do:

1. Log in to your Supabase dashboard
2. Go to "SQL Editor"
3. Copy the entire contents of the file supabase/schema.sql from your project
4. Paste it into the SQL Editor
5. Click "Run"
6. Check for any error messages — there should be none
7. Go to "Table Editor" and confirm all 8 tables exist

Important — New helper functions added during the audit:

Function	Purpose
increment_creator_earnings	prevents race conditions when multiple payments arrive at the same time
increment_product_sales	atomic sales counter
increment_event_tickets	atomic ticket counter
process_donation	atomic donation processing
increment_creator_views	atomic view counter

6

Test With a Real Pesapal Payment

The checkout flow has been fixed and tested in mock mode, but it is **essential to test with a real mobile money payment** before going live.

What to do:

1. Make sure your Pesapal account is in **LIVE mode** (not sandbox)
2. Open your store as a buyer would
3. Click **"Buy Now"** on a product
4. Enter your name and email
5. Select **"MTN Mobile Money"** as the payment method
6. Complete the payment on the Pesapal page using your phone
7. After payment, you should be redirected to the success page
8. Check that the download link works
9. Check the creator's dashboard to confirm the balance increased by **90%** of the purchase price

7

Verify Admin Access

The admin dashboard is now properly protected. Make sure your admin account works correctly.

What to do:

1. Log in with your admin email (nkevinmegan@gmail.com) and password
2. You should be taken to the regular dashboard first
3. Navigate to /admin in your browser
4. You should see the admin dashboard with platform stats
5. Try logging in with a non-admin account and navigating to /admin — you should be redirected to the regular dashboard

8

Production Deployment Checklist

Before going live, confirm all of these are set up on your production server:

- ☐ All environment variables from .env are set on the production server (never commit .env to git)
- ☐ The domain keevanstore.in is pointing to your server
- ☐ SSL/HTTPS is enabled (required for Pesapal and secure cookies)
- ☐ The server is running the production build (not development mode)
- ☐ File uploads are working (R2 bucket is accessible)
- ☐ Database schema has been applied
- ☐ Pesapal IPN URL is registered
- ☐ WhatsApp support links are working on store pages
- ☐ A real payment test has been completed successfully

End of Manual Actions

Complete all items above before launching to production.
